

Fork Positioner for Forklift

Forklift Fork Positioner - The fork positioner is actually a hydraulic device that could allow the driver to be able to maneuver the lift truck without leaving the seat. They are made out of top quality materials and are intended to be able to endure the most challenging operations and work surroundings. Side shifting units have the added ability to laterally position the entire load or the arms so as to facilitate much more precise carrying and position in a quicker and more effective way.

The fork pocket is somewhat unique and could enable the person operating it to be able to securely swing the blades into position without any fear of destroying the positioning cylinders. This can allow the driver the option to execute independent or simultaneous fork movement, dependent upon the job requirement. For most lift trucks with non-OEM carriages, complete carriages are necessary. Standard OEM carriages could be transformed into blade positioners on available units.
