

Forklift Grapple

Forklift Grapple - Grapples work along with the crowning operation of the bucket cylinder located on the excavator. They could mount directly onto the jib or whatever quick hitch which is in bucket position. Grapples are most often meant for the handling and processing of timber, construction materials, domestic and aggregate waste items. The grapple's boxed design has added support bridging. This particular manufactured design provides the grapple with maximum support and strength by way of stopping the body from breaking and twisting through its operation.

The grapple and all of its moving parts are constructed of hardened steel. The revolving points are designed to ensure supreme closing force and holding ability. The one operating it has the capacity to handle all sizes and varieties of materials due to the jaws built-in at the end of the grapple with toes. This can enable the jaws to close through one another in a finger configuration for utmost handling capacity.
